Playa Bets - Data Structure, Usage & Platform Readiness Assessment

An internal review of data structure, current use cases, and readiness for platform consolidation

Confidential -Internal Use Only -January 2026

Prepared by Alternata

1. Executive Summary

Alternata, using the Sidekick discovery platform, completed a structured analysis of Playa Bets' data environment to understand:

- how the data is structured today,
- how it supports internal operational and analytical use cases,
- and how ready it is to be consolidated or migrated into a unified internal data platform.

Following the Sidekick Discovery process, we conducted a structured analysis of Playa Bets' underlying data warehouse and analytical environment (isbets_bi). The discovery confirms that Playa Bets has a highly mature, granular and monetisation ready data foundation, with strong coverage across player behaviour, betting activity, financial transactions, bonuses, and compliance.

The platform's data model is already suitable for:

- Advanced internal analytics (risk, trading, CRM, compliance)
- External data products (aggregated spend, market intelligence, benchmarking)
- Partner integrations and privacy safe monetisation initiatives

Playa Bets already operates a mature, production grade analytical data environment.
The current data model is coherent, well structured, and actively supporting core business functions. From a technical and structural perspective, the data is ready to be abstracted, consolidated, and transferred into a centralised internal analytics platform with no fundamental redesign required.

2. Scope & Inputs

This report is based on:

- Sidekick automated discovery and ontology mapping
- Review of the isbets_bi database structure (685 tables)
- Playa Bets discovery outputs and categorisation workbook

3. High Level Data Architecture Overview

3.1 Scale & Complexity

- Total tables: ~685
- Primary domains: Users, Bets, Events, Transactions, Bonuses, Sessions, Compliance
- Design pattern: Highly normalised relational BI schema

- Temporal depth: Full historical tracking with versioning and audit trails

This structure supports both real time operational use and longitudinal analysis over player lifecycles, betting behaviour and financial performance.

4. Core Data Domains Identified

4.1 Player & Identity Data

Key characteristics:

- Persistent player IDs and hierarchies
- Session level tracking
- Self exclusion and responsible gaming flags
- User notes and historical status changes

Value:

- Lifecycle analysis
- Churn and retention modelling
- Compliance and AML monitoring

4.2 Betting & Event Data

Key characteristics:

- Full event, market, odds and bet lineage
- Support for multiple bet types and outcomes
- Historical odds and result snapshots

Value:

- Market movement analysis
- Odds drift and liquidity risk
- Historical benchmarking by sport / league / market

4.3 Financial Transactions & Balances

Key characteristics:

- Deposits, withdrawals, settlements

- Balance level tracking (cash and bonus)
- Currency handling and reconciliation

Value:

- Player value segmentation
- Spend velocity and frequency indicators
- External spend intelligence products (aggregated)

4.4 Bonuses & Campaigns

Key characteristics:

- Campaign definitions
- User level participation
- Bonus balances and redemption

Value:

- Bonus ROI analysis
- Campaign effectiveness benchmarking
- Player incentive optimisation

4.5 Compliance, Audit & Risk

Key characteristics:

- Detailed logs and audit trails
- Duplicate detection
- Schema versioning

Value:

- Regulatory reporting
- Forensic analysis
- Trust layer for external data sharing

5. Current Analytical Uses

Based on discovery, Playa Bets' data currently supports:

5.1 Operational & Regulatory

- Player monitoring
- Responsible gaming enforcement
- Transaction auditing

5.2 Commercial & Trading

- Bet volumes and outcomes
- Market performance
- Promotion analysis

5.3 Internal Insights

- Player segmentation
- Risk scoring
- Performance reporting

6. Platform Migration Readiness

There are no structural blockers to internal platform consolidation:

- Tables and domains are clearly defined
- Business entities are consistently modelled
- Time based partitioning and history are present
- Sensitive fields can be governed, masked, or isolated

The work required is mapping and optimisation, not re-engineering.

An internal readiness assessment is presented below.

Dimension	Status	Interpretation
Data Coverage	Green	All core business domains well represented
Structural Coherence	Green	Clear, consistent relational design
Historical Depth	Green	Strong time series and audit trails
Operational Dependence	Green	Data actively used in core operations
Analytical Usability	Green	BI ready, queryable schema
Platform Portability	Green	Suitable for migration or replication
Governance Formalisation	Amber	PII classification and masking to be formalised
Canonical Data Model	Amber	Business abstraction layer not yet standardised
Performance Optimisation	Amber	Indexing and aggregation tuning opportunity

7. Monetisation Readiness Assessment

7.1 Strengths

- Extremely granular first party data
- Clean separation of operational vs analytical tables
- Strong temporal consistency
- Mature compliance and audit structures

7.2 Gaps (Solvable)

- No explicit data product layer (yet)
- No standardised external schemas for sharing
- Limited abstraction between raw tables and commercial outputs

These gaps are typical and do not require changes to source systems.

8. Priority Data Product Opportunities

Based on Sidekick classification, the following product families are immediately feasible:

8.1 Spend & Market Intelligence

- Aggregated betting spend by sport / market
- Time series market movement indicators

- Category level benchmarking

8.2 Player Behaviour Indices (Anonymised)

- Engagement intensity scores
- Frequency and recency indices
- Bonus sensitivity metrics

8.3 Trading & Risk Signals

- Odds volatility indicators
- Event liquidity signals
- Market stress indices

8.4 Compliance & Industry Reporting

- Responsible gaming trend reporting
- Market level risk summaries
- Regulator and partner facing insights

9. Governance & Privacy Positioning

The existing schema strongly supports:

- Aggregation first data sharing
- Anonymisation and derivation
- Clean room or PET based collaboration

This places Playa Bets in a low risk, high trust position for any external data initiative.
